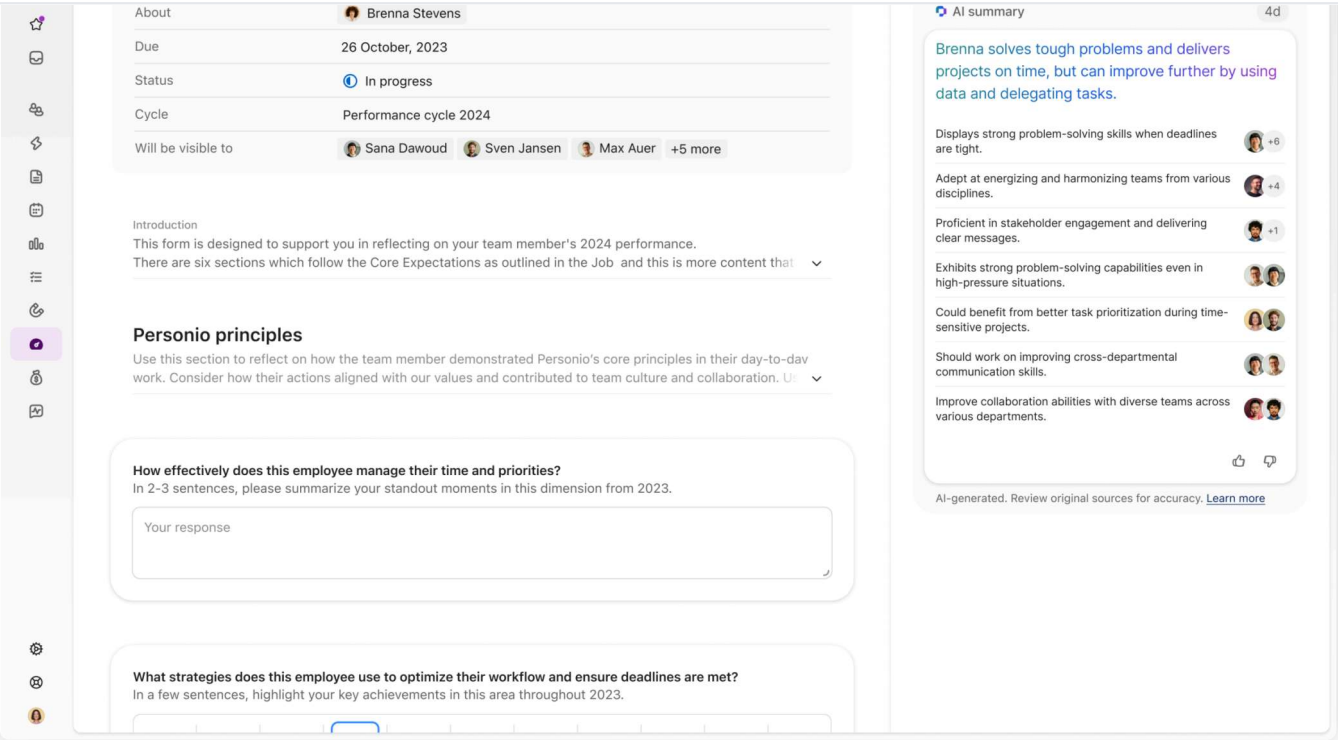
# Set up AI summaries

AI Performance Summaries provide an AI-generated summary of all continuous feedback, manager, peer and upward reviews, as well as performance notes related to an employee. The feature helps supervisors evaluate performance and write manager reviews.

Contact Support



**Before you start**

## Access rights

To activate AI summaries, you need the Administrator role.

## Understand AI summaries

This functionality can synthesize feedback, notes, and reviews about an employee into an aggregated summary. You can check the summary in the employee profile window and in the side panel when writing a manager review.

The AI summarizes feedback from the previous twelve months. It includes information from:

- Manager reviews (only if shared).
- Peer and Upward reviews.
- Continuous feedback (received).
- Performance notes.

Contact Support

- Manager reviews are more relevant. Upward reviews, peer reviews, continuous feedback, and notes follow in this order.

It updates the summary automatically when the employee receives new feedback.

### Important notes

It's important to note that AI summaries:

- Are meant to support, not replace, the manager's judgment. They synthesize feedback but should not be the only input for performance decisions or reviews.
- Need a minimum of three reviews (or feedback instances) to activate.
- Do not introduce any new information. All information comes from existing written feedback feedback (not ratings).
- Rely on the amount of contextual information contained in the original feedback. The more information the AI finds in the feedback, the better the summary is.

### Activate AI summaries

To activate AI summaries, follow these steps:

1. Go to **Settings.**
2. In the **Account** section, click **AI features**.
3. Click the toggle to activate Personio's AI features.

Once activated, supervisors can see AI summaries in the performance profile page of their reports and when writing manager reviews.

### Use AI summaries in manager reviews

When writing a manager review, you can read the AI summary in the panel on the right:

1. Under **Summary**, access the information by themes for better readability. Click each theme to see the original sources that the AI draws on (feedback, reviews, and performance notes).

## FAQ

### What data does the AI Performance Summary access in Personio?

The AI Performance Summary accesses performance reviews, feedback, and notes ("inputs") about an employee stored in Personio. This includes the type of input (review, continuous feedback, note), the created date of the input, the id of the input, and the id of the provider of the input. It also includes whether or not the input was marked as confidential (for the recipient of the input).

AI Performance Summary does not include self reviews, and does not include feedback that is not visible to the manager.

### Does the AI Performance Summary comply with access requirements that are in force in Personio?

Yes, the AI Performance Summary enforces access requirements as set up in Personio. The Summary is only available to people who already have access to view the performance reviews, feedback, and notes about an employee. Any feedback that is not shared with these people is not included in the summary.

### What is the technical set-up of the AI Assistant?

Personio uses the LLM Claude from Anthropic for the processing of AI Performance Summaries. Claude LLM is hosted by Personio on its AWS Servers in the EU using AWS Bedrock.

### How is the LLM instructed to generate an AI Performance Summary?

The LLM is instructed to provide a fair, objective, and actionable summary from employee feedback data to assist managers.

Instructions (paraphrased) that the LLM is given to prevent harm:
- Avoid bias, speculation, and unfounded conclusions.
- Never make assumptions about protected characteristics (age, gender, race, etc.).

Contact Support

- No limits on the number of themes the summary can include, to prevent exclusion of valid perspectives.

There must be a minimum of three reviews, pieces of feedback, or notes in order to generate a summary.

We weight sources based on their type in order to provide a useful summary to assist managers when writing reviews: most recent manager review, upward reviews > peer reviews, continuous feedback > performance notes > less recent manager reviews. Self reviews are excluded. We put a higher weight on more recent feedback and reviews.

### Why are manager reviews included and prioritised as a source for the summary?

We include and prioritise the most recent manager review because it reliably incorporates the rich, integrated view that managers have of an employee's performance, provides useful continuity between cycles (i.e. it's helpful for managers to see their last review included), and ensures that skip-level managers and administrators also see the manager's perspective in the summary. Other sources are still incorporated to provide a balanced, well-rounded view.

### Is the data leaving the EU?

No. The LLM used by the AI Performance Summaries is hosted by Personio in its own AWS servers using Bedrock. The same server location and hosting area applies as for AWS.

### Does AWS Bedrock or Claude store any personal data?

No. Personal data is not stored by either AWS Bedrock or Claude. There is a zero storage policy in force with AWS Bedrock.

### Is our personal data used for training?

No customer data is used for training purposes by Personio or any other third party.

### Is the use of the AI Performance Summary mandatory?

Contact Support

the Performance & Development Product.

### Who has access to AI Performance Summaries?

If Admins opt in to the feature, access is given to all managers and admins with access to the relevant employee data. Admins of customers manage for every customer which employees have access to this baseline performance data.

### Can I opt-out from the AI Performance Summaries?

Yes, because AI Performance Summaries are an opt-in feature. The feature can be activated by enabling AI Performance Summaries in Settings > Account > AI features.

### Does Personio store any data in relation to the use of AI Performance Summaries?

Yes. Personio stores output data in order to render the AI Performance Summary and keep it consistent across multiple viewings. This output data is NOT FOR TRAINING purposes.

### Does the AI Performance Summary make decisions for me?

No, there is no AI-only decision making that happens. We provide an assistive summary for managers and admins to make better decisions, but humans are the ones making all decisions.

### Who is responsible for the accuracy of output data?

The AI Performance Summary only accesses data that is provided by customers and uploaded to Personio. Thus, customers are solely responsible that the data used to produce outputs is accurate. In any case, all output shall be reviewed by users and customers.

### Are there any risks or limitations in using the AI Performance Summary?

Artificial intelligence and machine learning technologies have known and unknown risks and limitations. The customers are solely responsible for (i) developing their own internal policies regarding the appropriate use of the AI Performance Summary technology and training other users on their account on such policies, (ii) providing

Contact Support

oversight for the use of the AI Performance Summary.
